

**ICS 105:  
Project in HCI**

Techniques I:  
Cognitive Walkthroughs and  
Paper Prototypes

### the usability requirement

YOUR USER REQUIREMENTS INCLUDE FOUR HUNDRED FEATURES.

DO YOU REALIZE THAT NO HUMAN WOULD BE ABLE TO USE A PRODUCT WITH THAT LEVEL OF COMPLEXITY?

GOOD POINT. I'D BETTER ADD "EASY TO USE" TO THE LIST.

### administrivia

- project teams
  - check the web page and see if it's right
  - email us with team rosters and assignments
- project guidelines document
- meetings with Doshi
  - check information at <http://www.ics.uci.edu/~jpd/ics105>

### design/evaluation techniques

- design and evaluation are tightly coupled
  - in fact, we want to get them as close as possible
    - evaluate as you design
    - design as you evaluate
    - iterate on the results
- next few lectures focus on techniques
  - methods and mechanisms
  - design & evaluation
  - apply at different stages

### inspection techniques

- two basic approaches
  - user-based techniques
    - watch real people use the interface in more or less formal settings
  - inspection-based techniques
    - evaluation of the interface through inspection by experts
    - similar to SE code review
- generally, you need *both*
- caveats
  - only as good as the people performing them
  - only as good as the theories they embody

### inspection techniques

- structured versus unstructured approaches
  - methods
  - reports
- the difficulty of finding the right reviewers
- various approaches
  - usage simulation
  - heuristic evaluation
  - cognitive walkthrough

## heuristic evaluation

- structured evaluation against heuristics
  - use simple and natural dialogue
  - speak the users' language
  - minimize user memory load
  - be consistent
  - provide feedback
  - provide clearly marked exist
  - provide shortcuts
  - provide good error messages
  - prevent errors

## heuristic evaluation

- advantages
  - faster and easier to perform
  - structure helps get the process started
  - good place to start
- disadvantages
  - very generic, not specialised to different needs
  - not particularly detailed
  - heuristics needs to be interpreted

## cognitive walkthrough

- what's a cognitive walkthrough?
  - walkthrough – stepping through the interface as a user would encounter it
  - cognitive – evaluating, step-by-step, the cognitive loads and requirements of the interface
- structured technique
  - structure imposed by the task being performed
  - very structured report format

## cognitive walkthrough

- goals and tasks
  - cognitive walkthrough of
    - a particular interface, being used to perform
    - a particular task
- procedure
  - define task and actions
  - step through execution
    - at each step, ask a series of questions
    - focused on goal formation and goal achievement
    - ask, what percentage of people will have a problem?

## cognitive walkthrough

- problems forming correct goals
  - failure to add goals
  - failure to drop goals
  - addition of spurious goals
  - no-progress impasse
  - premature loss of goals
  - supergoal kill-off

## cognitive walk-through

- problems identifying action
  - correct action doesn't match goal
  - incorrect actions match goals
- problems performing the action
  - physical difficulties
  - time-outs

## walkthrough sheet

1. description of user's immediate goal
2. (first/next) atomic action user should take:
  - a. obvious that action is available?
  - b. obvious that action is appropriate?
3. how will user access description of action?
  - a. problem accessing?
4. how will user associate description with action?
  - a. problem associating?
5. are all other available actions less appropriate?
6. how will user execute the action?
  - a. problems?
7. if timeouts, time for user to decide before timeout?
8. execute the action, describe system response
  - a. obvious progress made towards goal
  - b. user can access needed information in response?
9. define appropriate modified goal, if any
  - a. obvious that goal should change?
  - b. if task completed, is it obvious?

## cognitive walkthrough

- advantages
  - systematic evaluation
  - theory-based
- disadvantages
  - experts can be biased and blind-sided
  - extremely time-consuming and detailed
    - various alternative approaches exist
      - the cognitive "jog-through"

## paper prototypes

- early engagement with users
  - the earlier the better... head off problems
  - better to engage before you start to build
  - minimise wasted development effort
- paper prototyping
  - user engagement with interface mock-ups
  - paper isn't interactive, so you need to be

## paper prototyping

- before you start
  - what you'll need
    - heavy paper, index cards, tape, pens & markers, scissors
    - a well-worked out design!
    - tasks and scenarios
  - build the model
    - draw window frame on large paper
    - put different screen regions on card
      - anything that appears, disappears, changes, moves
    - ready response for user action
      - pull-down menus, for example
    - use photocopier to generate generic objects
      - error and input dialogs

## paper prototyping

- beforehand
  - select your users
- the session
  - introduce them to the interface and the task
    - give tasks IN WRITING
- afterwards
  - debrief (questionnaire)
  - ask about things you saw problems on
  - gather their impressions
  - thank them!

## paper prototyping

- during the session
  - one person to facilitate
    - interact with user – *ONLY PERSON WHO SPEAKS!*
    - keep getting "output" from user
      - "what are you thinking now?"
      - "what do you need to do next?"
    - you're there to *observe*
      - not to laugh, observe, comment, criticize, or guide
  - one person to "be the interface"
    - respond to user input
    - simulate the application logic

## paper prototyping

- during the session (contd.)
  - one person to supply the interface
    - manage the paper resources
    - produce new ones
    - keep track of what's going on and likely to happen
  - one person to observe and take notes
    - no intervention, just watch and observe

## paper prototyping

- important things to remember
  - you need to really know the interface
    - you can't go into this with a partial understanding
    - know what happens for each potential mouse click
  - you can always generate new interface components
    - many will be generated on the fly
    - remember that paper can be layered...!
  - figure out where precision's needed and where it's not
  - when "being" the interface, be no more or less
    - no extraneous hints
    - just respond to what the user's doing

## paper prototyping

- advantages
  - takes only a few hours
  - no equipment needed
  - can test multiple alternatives
- disadvantages
  - some interfaces more complex to fake
  - can be hard to achieve suspension of disbelief

## silk video

## for next time

- still need those project groups!
- make appointment times with Doshi
- next time, more on techniques
  - usage data and predictive evaluation
  - ch 30, 31
